Persisten Lyme Infection 1991

LIEGNER CALL FOR REBELLION ON PART OF LYME DISEASE PATIENTS

http://lookingatlyme.blogspot.com/2013/05/liegner-call-for-rebellion-on-part-of.html

Excerpt:

"In 1991 the Lyme disease organism, Borrelia burgdorferi, was grown from the cerebrospinal fluid of my patient Vicki Logan at the Centers for Disease Control in Fort Collins, Colorado despite prior treatment with intravenous antibiotics. Her case made the front page of the New York Times Science Times in August of 1993."

When he reported to Dr. Liegner the CDC's positive culture for B. burgdorferi from Vicki Logan's spinal fluid despite her having received 21 days of IV cefotaxime and 4 months of oral minocycline, Dr. David Dennis inquired of Dr Liegner whether he had culturing capability for borreliae in his office (which he did not). The implication was that perhaps, deliberately or unwittingly, Dr. Liegner may have contaminated the specimen with live borrelia being grown in his office. Evidently, Dr Dennis had a hard time conceptualizing that borrelia (Lyme bacteria) could be isolated in culture despite such intensive antibiotic treatment.
